

Attribute functions similarly to Image:

- Sprite (Sprite):

The sprite used for rendering. This sprite will be used as the texture for the custom graphic.

- m_SegmentCount (int):

The number of segments used to create the circular frame. Increasing this value results in a smoother frame, while decreasing it creates a more polygonal appearance. A value of 4 generates a rectangular shape.

- m_OutlineWidth (float):

The width of the frame's outline. This value determines the thickness of the border between the inner and outer parts of the frame.

- m_PreserveAspect (bool):

If true, the aspect ratio of the sprite will be preserved when rendering the frame. This ensures that the sprite does not appear stretched or squashed.

- m_FillAmount (float):

A value between 0 and 1 that controls how much of the frame is filled. A value of 1 fills the entire frame, while lower values fill only a portion of it.

- m_UVSpeed (float):

The speed at which the UV coordinates are moved across the texture. This creates an animated scrolling effect on the texture.
